PROFESSIONAL SUMMARY

AI solutions engineer and applied research leader with 10+ years of experience in network AI, security AI, product-oriented research, standardization, and university-collaboration project management. Strong at bridging engineering practice, research collaboration, and product/investment decisions: translating business and technical pain points into collaborative research topics, and communicating project value, technical roadmaps, and delivery potential to product and investment teams. Recently focused on RAG, agentic workflows, context engineering, multi-agent security evaluation, and local AI memory systems.

CORE CAPABILITIES

GenAI Engineering

RAG/hybrid retrieval, agentic workflows, context engineering, POCs, and coded demos.

Network & Security AI

Intrusion analysis, threat intelligence/XDR, telemetry, root-cause localization, IPv6/BGP, explainable diagnosis.

Solutions & Ecosystem

Technology selection, project management, benchmark design, technical insights, product/research/academia/customer communication.

SELECTED PROJECTS

Self-Evolving Multi-Agent System for Cybersecurity

Team Project

- Designed an agentic workflow for cybersecurity defense: the static layer combines CVE, threat intelligence, and multi-source XDR data, using RAG to strengthen intrusion detection and alert explanation; the dynamic layer explores prompt/policy evolution from historical interactions.
- Personal contribution:** owned internal/external technical presentations, prompt-evolution mechanism research, and prototype development; contributed to multi-agent framework design and red-team/blue-team benchmark methodology.

Technology Insight and Topic Generation Agent

Personal Project

- Aggregates historical insight reports, internal project/expert relationship context, internal technical blogs, external RSS, X/Twitter, and competitor technical blogs to generate timely signal lists, deep-dive topics, and connected technical leads.
- Assists insight-report drafting by automatically analyzing relationships with past topics, fit with current hotspots, theme classification, and timeline reconstruction.

Collaboration Project Management Agent

Personal Project

- Extracts project state from technical cooperation contracts, project emails, meeting minutes, and milestone materials; generates risk alerts, outcome summaries, meeting reminders, and suggested agenda items.
- Promoted among collaboration project managers to reduce repetitive work in progress synchronization, material organization, and phase-review preparation.

AI-Driven Network Telemetry

Team Project

- Built event-driven analysis for resource-constrained network devices such as routers, operating on full YANG policy data and reporting only event-relevant features plus localization explanations.
- Personal contribution:** project owner responsible for feature definition, algorithm research, prototype validation, and engineering delivery; shipped into Cisco IOS-XR 7.3.1 and resulted in US Patent US11115280B2.

IETF RFC 8801

Team Project

- Enterprise IPv6 multi-provider deployment standard supporting IPv6 configuration discovery and deployment in multi-operator / multi-network-provider environments.
- Personal contribution:** developed the Linux kernel patch and contributed to standard drafting; co-authored IETF RFC 8801 and maintained open-source validation code.

- [Shiye](#): external-brain memory system exploring session-less interaction, lifelong summaries, local SQLite + FAISS persistence, hybrid retrieval, and time-aware context.
- [Shredder](#): agentic search workflow for more complete coverage of academic papers satisfying multi-cue search conditions.
- [Skill-abstract-art](#): explores controllability of generative agents through explicit composition decisions, constrained motifs/rules/palettes, and multi-version comparison.

PROFESSIONAL EXPERIENCE

Principal Engineer - Huawei Paris Research Center, France

May 2021-Present

- Lead European university-collaboration programs for the data communication product line: translate internal product/business pain points into research topics, technical roadmaps, and funding proposals; drive project approval and milestone reviews.
- Manage a cross-domain PM team of ~15 people and coordinate an ecosystem of ~30 internal/external collaborators across university partners, research programs, and internal technical teams.
- Track projects from approval to final delivery; identify outcomes that can become product competitiveness, IPR, or long-term technical assets, and report project value to investment decision makers.
- Build connections with European universities and top scholars through workshops, conferences, collaboration visits, and expert exchanges; convert external insights into internal new-project opportunities.

Research Engineer - Cisco Systems, France

Dec 2017-May 2021

- Led IOS-XR AI-Driven Telemetry research, creating a lightweight, event-oriented network telemetry summarization method and obtaining US Patent US11115280B2.
- Contributed to IETF RFC 8801 standardization, supporting IPv6 deployment in multi-provider environments.

PhD Candidate - Telecom ParisTech, France

Mar 2014-Nov 2017

- Developed a measurement-based inter-domain traffic engineering system later adopted by a start-up.
- Designed root-cause localization algorithms for large-scale Internet performance issues, combining latency measurements with Internet topology inference.

Network Analyst Intern - Google, Switzerland

Oct 2016-Dec 2016

- Implemented a quasi-real-time analytics pipeline for campus WiFi quality-of-service monitoring and anomaly detection.

TECHNICAL WRITING

- [Snow River Notes](#): ongoing writing on LLM-agent external memory, learnable "small brain" plus deterministic scaffolding, RAG/context engineering, Skill-based workflows, and related topics.

EDUCATION

2014-2017	Ph.D., Measurement-based Inter-domain Traffic Engineering, Telecom ParisTech, France
2010-2013	M.Eng., Communication Networks, Telecom ParisTech, France, GPA 3.99/4.0
2006-2010	B.Eng., Telecommunications, Fudan University, China, GPA 3.58/4.0, ranked 5/53

STANDARDS, PATENTS & PUBLICATIONS

- IETF RFC 8801: Discovering Provisioning Domain Names and Data, 2020.
- US Patent US11115280B2: Data-driven identification and selection of features related to a state change of a network component, 2021.
- IEEE/IFIP NOMS 2020 and IEEE/IFIP IM 2021: semantic feature selection, network-element state transition detection, and on-box demo.
- IEEE/IFIP NOMS 2016, ITC 2017, ACM CoNEXT SW 2016: inter-domain traffic engineering, RTT measurement quality, and path-change analysis.
